SCIENTOMETRIC STUDY OF SCIENTIFIC LITERATURE ON THE ESTUARIES OF CEARÁ STATE

Estudo cienciométrico da produção científica sobre estuários do Estado do Ceará

Samuel Soares Valentim¹, Maria Ozilea Bezerra Menezes²

ABSTRACT

Estuaries are one of most important coastal environmental system it has been a subject of study worldwide. Many researches have been done on estuarine dynamics, especially regarding the circulation and mixing process, in order to understand the principles of estuarine physical oceanography. However the knowledge on estuaries of Ceará state about hydrodynamics conditions has a significant unequal distribution of studies realized over different sectors of the Ceará coast. An inventory was realized to select the main publications available from estuaries of Ceará state inside physical oceanography area. Resulting in a total of 100 publications. These publications were classified as Grey and White literature and the type of literature is associated with low or high repercussion in the academic community. Results showed that 77% was classified as Grey literature and 23% White literature. 52% of studies were realized on estuaries located in east coast of Ceará state (sector 3), mainly in the Jaguaribe river by the great importance of this system, 22% in the west and extreme west coast (sector 1), 21% in the metropolitan region of Fortaleza (sector 2) and 5% are studies in more than one estuaries or sector of coast. There was a historical evolution of research in the estuaries of Ceará, with increase in the number of published studies and consequently a higher level of knowledge, mainly in the Jaguaribe River basin.

Keywords: state of knowledge, literature impact, critical review, estuary.

RESUMO

Os estuários são ambientes costeiros de grande importância econômica, social e ambiental ao redor do Mundo. Muitos estudos têm sido realizados sobre dinâmica estuarina, principalmente relacionado com circulação e processo de mistura para melhor compreensão dos princípios da oceanografia física estuarina. A distribuição dos estudos realizados nos estuários do Estado do Ceará relacionado com a área de hidrodinâmica estuarina apresenta uma desigualdade e/ou um maior interesse pelo principal sistema estuarino da região, o rio Jaguaribe, o que reflete em quantidades distintas de estudos entre os três setores da costa cearense. Ao todo foram selecionados 100 estudos publicados para realizar uma distribuição dos estudos em relação o setor da costa e classificação em Literatura Cinza e Literatura Branca. Os resultados mostram que 77% das publicações são classificadas como Literatura Cinza e 23% como Literatura Branca. 52% dos estudos foram realizados em estuários localizados no litoral leste (setor 3), sendo 42 estudos no estuário do rio Jaguaribe, 22% nos estuários do litoral oeste e extremo oeste (setor 1), 21% nos estuários da região metropolitana de Fortaleza (setor 2), e, 5% são estudos realizados em mais de um estuário e/ou setor do litoral.

Palavras-chaves: estado do conhecimento, Literatura de impacto, revisão crítica, estuário.

INTRODUCTION

Scientometry, known as quality research of scientific production, began in the 1960's within UNESCO and Organization for Cooperation and Economic development (OCED), who created methods to evaluate scientific and technological activities (Spinak, 1998). Estuaries are considered important bodies of water not only for environmental services, but also for their value in economy (ports, fishery, and aquaculture) and social aspects (community development). For this reason, to understand estuaries' circulation and mixture processes is a fundamental step to apply the precautionary principle, in other words, to provide the necessary knowledge to analyze scenarios of environmental impacts such as transport of pollutants, hypersalinization conditions, decline of number's species, water quality.

In the last 60 years, many definitions and classifications of estuaries were developed to cover the characteristics of these environments throughout the world (Pritchard, 1952; 1955; 1956; 1960; 1967; Fairbridge, 1980; Kjerfve, 1986; Dyer, 1991, 1997). The majority of the definitions of estuaries were based on the conditions of estuaries in temperate regions of the northern hemisphere however such definitions negligence features as hypersaline conditions during dry periods or estuaries that periodic closure of their mouths (Day, 1980). Potter *et al.* (2010) created definition with main characteristic of all estuaries: "An estuary is a partially enclosed coastal body of water

that is either permanently or periodically open to the sea and which receives at least periodic discharge from a river(s), and thus, while its salinity is typically less than that of natural sea water and varies temporally and along its length, it can become hypersaline in regions when evaporative water loss is high and freshwater and tidal inputs are negligible"

The Ceará State has a 573-km long coastline and is divided into three sectors: I - extreme west and western coast; 2 - metropolitan region of Fortaleza; 3 - eastern coast. Its estuaries are under semiarid climate conditions which are the predominant feature in 95 per cent of the state's watershed (Campos *et al.* 2000). In addition, all of them have been significantly impacted by dams built in medium and high river courses (Morais & Pinheiro, 2011). The main characteristics of the rivers on Northeastern region, where Ceará State is located, are intermittent rivers, wet and dry season (no rain) and Dam built to maintain sufficient water resources for consumption and human activities.

Studies realized on estuaries of Ceará state based on hydrodynamics conditions have difference distribution quantification over east coast and other sectors of Ceará coast. An inventory selected one-hundred (100) publications about estuarine dynamic (Table 1). The goal of this paper is to quantify the studies on estuaries in Ceará state with focus in physical oceanography and then to classify these research per type of literature (grey or white literature).

Table 1 - Inventory of studies realized on estuaries of Ceará State, Northeastern, Brazil.

Type of Literature and repercussion

Undergraduate courses were institutionalized in Brazil since 1970s by 5.540/68 law. After that, bachelor's courses became the main players of Brazilian scientific production. On academic community, whereas career progress at universities and institutes considers scientific production index as evaluation, students are pushed to publish since early terms. The knowledge produced at university is usually launched on some communication channels that differ a study area to another, or from

research to another. Formal publications (e.g. abstracts, reports, and thesis) are considered driving force to academic community since publications seeks to developing the system, promoting the knowledge generation cycle (Cavalcanti, 2000). However, these formal publications are generally written in local languages and limit the international repercussion of the research.

This paper is focused on classification per type of literature: Grey literature and White literature. Grey literature is defined as documents produced on all levels of government, academics

(symposiums, conferences, meetings, and thesis), business and industry in print and electronic formats, but not managed by commercial publishers (Alberani, 1990; GL'99 Conference Program, 1999). Usually, grey literature have difficult access (technical reports, abstract or texts published in proceedings), or published at one specific language (other than English) which limits its wider publicity and knowledge. White Literature is considered publications in articles in periodicals with high repercussion on academic community.

METHODS

This paper to choose investigate which scientists or research groups that more published about estuaries in the Ceará state, with focus in physical oceanography area. Many keywords as

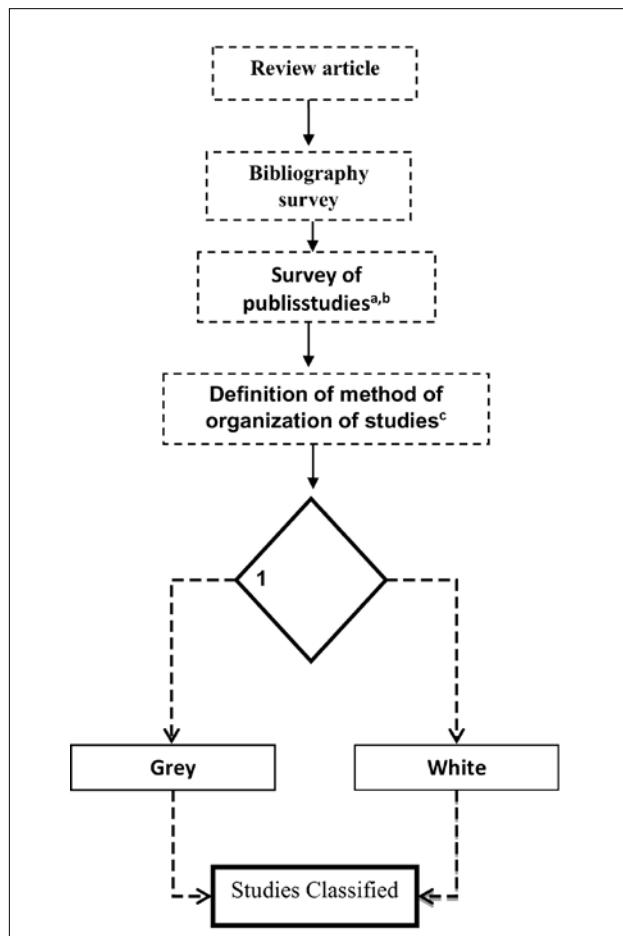

Figure 1 - Classification flowchart of studies by type of literature.a Studies carried out in the estuaries of Ceará state with focus on Physical Oceanography; b Total of 100 publications from the period 1974-2015;c Type of document, Location of the estuary, Classification by type of literature. 1 - Grey (Monograph, Master Thesis, PhD Thesis, Academic events, e.g. abstract); 2 - White (Papers).

names of the estuaries and main terms of area (e.g. "Hydrodynamic", "Hydrology", "Dam built", "Salinity profile", "Current velocity") have been used to facilitate the selection of studies as well as any websites (e.g. capes periodics, science direct). Resulting in total of 100 publications available online: academic events (abstracts, extended abstracts, dissertations (master's thesis), thesis (PhD) and articles) (Figure 1). Each study was divided by year, author, title, name of estuary, location based on sector of Ceará State, publication media, and type of literature.

Further, it was researched the classification by WebQualis/CAPES referring to each periodic that studies were published.

RESULTS

The main product of this research was to quantify a maximum number of studies and to classify by location and type of literature (Table 1). This research was developed to facilitate future studies, with a compilation of existing studies to serve as background. Table 1 exhibits all publications selected. The distribution of the studies are in chronological order and dates from 1974 to 2015. The elaboration of inventory identified one main research group that publish and develop studies about estuaries in Ceará State - Laboratory of Geology and Geomorphology coastal and oceanic at State University of Ceará (LGCO/UECE) - that have principal focus with geomorphology, sediment transports, and hydrology aspects.

Among the selected publications of publications selected, 77% are considered Grey literature and 23% White literature (Table 2). Jaguaripe River is main hydric system of Ceará state and according to inventory (Table 1) were 42 studies performed on it.

According to Figure 2 only eleven studies were published before 2000 and eighty nine studies after 2000, from which it can be inferred that regional scientific production has been extensively developed until recently. These data are the result of more investment in education in the last decades, with greater availability of instruments for field works, research projects and research groups. However, can be identify number decreasing of publications in last year that refers to a possible change of focus of studies of the research groups and studies in the phase of elaboration.

The table 2 shows distribution of type of document (publications) over sector coastal of Ceará

Table 2 - Distribution of studies per sector coastal of Ceará state.

Type of document	Sector 1 (West extreme and west coast)	Sector 2 (Metropolitan sector of Fortaleza)	Sector 3 (East coast)	Others	Total	(%)
Paper	5	7	9	2	23	23%
Monograph	2	1	*	*	3	3%
Master Thesis	3	1	4	*	8	8%
PhD Thesis	1	1	1	*	3	3%
Academic events	11	11	38	3	63	63%
Total	22	21	52	5	100	100%
(%)	22%	21%	52%	5%	100%	

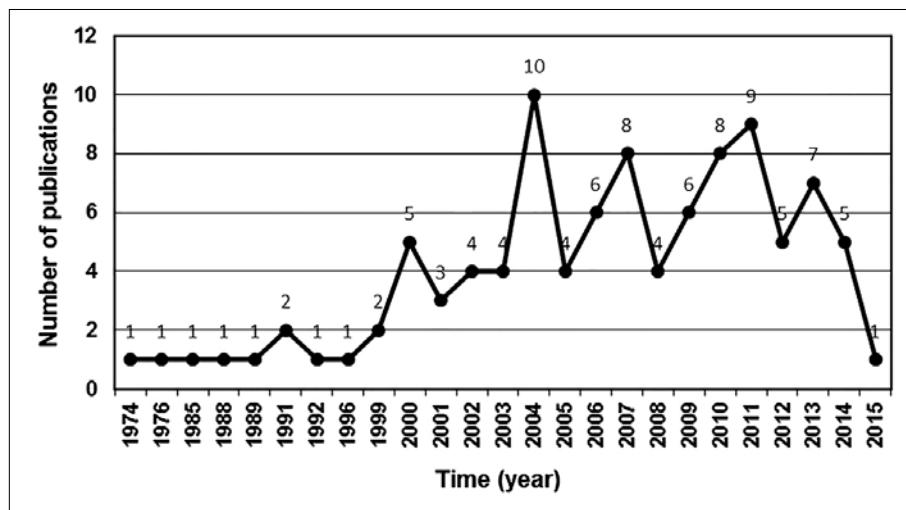

Figure 2 - Distribution of publications over time.

state. Among the main results, sectors 1 and 2 have almost the same number of studies, 22 and 21 studies, respectively. It was observed more white literature (papers) published (7) in sector 2 than in sector 1. Most studies (52) were realized in sector 3 (Sector 3), with predominance of studies published in academic events, e.g. abstract (grey literature). Also, sector 3 has more articles published in comparison to sector 1 and sector 2. However, considering all sectors of coast Ceará state, most studies have been published in academic events (63%).

The table 3 shows the classification of each periodic based on WebQualis defined by CAPES and impact factor by its own magazine/journal. According to Table 3, most publications were published in *Arquivos Ciências do Mar* (6 papers or 26% of total) which owns classification of "B5", followed by *Revista de Geologia* (3) and *Journal Coastal Research* (JCR) (2).

WebQualis is the set of procedures used by CAPES to measure the quality of the intellectual production of graduate programs. It is created to evaluate the national scientific system and is based on information provided by data collection application. As a result, WebQualis provides a list of the classification of journals used by graduate programs for the dissemination of its production. Measure of quality of this production is carried out indirectly.

Thus, WebQualis assesses the quality of articles and others types of production, from the analysis of the quality of the publications media, i.e. scientific journals. The WebQualis is divided into eight (8) types, in descending order of value: A1, A2, B1, B2, B3, B4, B5 and C describe below:

- A1 - with the highest impact factor equal to or greater than 3,800

- A2 - Impact Factor between 3,799 and 2,500
- B1 - Impact Factor between 2,499 and 1,300
- B2 - Impact Factor of 1.299 and 0.001
- B3, B4 and B5 - are indexed in MEDLINE, SCIELO, LILACS but without impact factor
- C - irrelevant, with zero weight.

According to classification of WebQualis system, periodic Hydrology process (2,696 impact factor – even A2) and Sociedade & Natureza (B1) have better impact on scientific community and publications with classification B3 to B5 have low or no impact.

Table 3 - Classification each periodic based with WebQualis/CAPES/impact factor.

Periodic	WebQualis CAPES	Impact Factor	Distribution

<i>Hydrological processes</i>		2.696 (2013)	1
<i>Brazilian Journal of Oceanography (impresso)</i>	B2		1

CONCLUSIONS

Perform a literature review requires caution and the need to define a coherent method for classifying. This research select published studies that have focus in estuarine hydrodynamic. The conclusions are based in these outcomes presented below:

- 1) 100 publications selected: 77% are considered Grey Literature with low repercussion and 23% White Literature with greater repercussion in the scientific community. The main characteristic of White Literature are the use of the English language in the articles, providing greater reach,

that is, it allows a greater number of researchers to access the content of the study.

- 2) Among the 100 studies, only 11 were published before 2000's and 89 studies after 2000's. There was considerable increase in the number of studies after 2000's, which promoted the development of state of knowledge of estuaries. 63% was published in academic events. The last year (2015) presented a decline in published studies and the possible reason is the delay in the preparation and publication of the studies. Also, the trend is to reduce the number of studies due cuts in Education funding.

3) According to the inventory, in the total of 100 studies, most of them were developed in estuaries located in the eastern sector of the state. Of the fifty studies performed on Sector 3, forty two were conducted in Jaguaribe River. The evolution of studies in the Jaguaribe River basin is an expected fact due to the economic and environmental importance of the system, with multidisciplinary groups conducting several studies in the region. The dam built, the understanding of physical processes in estuarine dynamic, and the wealth of local ecosystems become relevant the development of research in this system. Sector 3 (East Coast) have the higher number of articles published (9) too.

4) Sector 1 (extreme west and west coast) and Sector 2 (metropolitan region of Fortaleza) have similar number of studies. Its incomprehensible the lower number of studies performed in estuarine systems located in the western sector of the Ceará state, however, its assumed that the logistics and costs to realized field works justify this number.

- 5) The main studies were published in *Arquivos de Ciências do Mar* (6). One of the reasons for the major number of papers published in the regional journal may be to the consolidate the quality of the journal's publications.

Its essential to highlight the evolution of the number of researches carried out in the estuaries

of Ceará over the last decades and the several journals that studies were published (Table 3) indicate a better extension of regional researches in scientific community.
